

15 WCEE
LISBOA 2012

15TH WORLD CONFERENCE ON
EARTHQUAKE ENGINEERING
LISBOA 2012

CERTIFICATE

We certify that

Jafril Tanjung

participated in the 15th World Conference on Earthquake Engineering (15WCEE), held in Lisbon, Portugal, from 24th to 28th September, 2012.

Lisbon, September 28th, 2012

Luís Guerreiro
Secretary-General

João Azevedo
President of the
Scientific Committee

15 WCEE

Local Organizing Committee

Carlos Sousa Oliveira (President)
Ema Coelho (Vice-president)
Paula Teves Costa (Vice-president)
Luís Guerreiro (Secretary General)
Rogério Bairrão (Treasurer)
João Azevedo
Jorge Proença
Luís Arriaga da Cunha
Aníbal Costa
Raimundo Delgado

Scientific Committee

João Azevedo (President)

Committee Members:

Alex Barbat	Jason Ingham	Pierre-Yves Bard
Alexander Uzdin	Jean-François Semblat	Raimundo Delgado
Alfredo Campos Costa	João Carlos Nunes	Rita Bento
Andreas Kappos	Keh-Chyuan Tsai	Robin Spence
Aníbal Costa	Marcial Blondet	Ruben Boroschek
Anne Kiremidjian	Maria Ana Baptista	Rui Correia
Artur Vieira Pinto	Mario Ordaz	Rui Pinho
Atila Ansal	Mary Comerio	Sergio Lagomarsino
Carlos Ventura	Masayoshi Nakashima	Seth Stein
Costas Synolakis	Mauro Dolce	Sinan Akkar
Dan Lungu	Michael Fardis	Sonia E. Ruiz
Djillali Benouar	Mihail Garevski	Sudhir Jain
Eduardo Miranda	Mohsen Ashtiany	Sun Baitao
Gian Michele Calvi	Mourad Bezzeghoud	Takahisa Enomoto
Gregory MacRae	Omar Cardona	Thomas Wenk
Hong Hao	Paulo Lourenço	Utku Kanoglu
Iunio Iervolino	Peter Fajfar	Xilin Lu

Local Advisory Committee

Álvaro Cunha

Carlos Rebelo

E. Cansado Carvalho

Henrique Vicêncio

J. Miranda Guedes

João Estêvão

Joaquim Luís

José Fernando Borges

Luís Matias

Mário Lopes

Rui Gomes

Victor Hugo Forjaz

Ana Malheiro

Carlos Trancoso Vaz

Elsa Caetano

Humberto Varum

João Appleton

João Fonseca

Jorge Miguel Miranda

José Madeira

M. Gonçalves da Silva

Ruben Dias

Susana Custódio

Vítor Córias

António Arêde

Daniel Oliveira

Fernando Carrilho

Isabel Pais

João Cabral

João Luís Gaspar

José Correia Guedes

Laura Caldeira

Maria Luisa Sousa

Rui C. Barros

Valter Lúcio

Referees

A. Manafpour
Abdelhakim Ayadi
Achilleas Papadimitriou
Adamantia Athanasopoulou
Adrian Rodriguez-Marek
Ahmet Yakut
Akira Igarashi
Alessandro Annunziato
Alessandro Dazio
Alessandro Palermo
Alex Barbat
Alexander Tyapin
Alexander Uzdin
Alexandra Carvalho
Alexandre A. Costa
Alexandru Aldea
Alfonso Malaver
Alfonso Vulcano
Alfredo Campos Costa
Ali Bakhshi
Álvaro Cunha
Amador Teran-Gilmore
Amir M. Kaynia
Anastasios Sextos
André Monteiro
André Plunier
Andrea Penna
Andreas Kappos
Andrei M Reinhorn
Andrew Charleson
Andrew Whittaker
Angelo Marinilli
Angelo Masi
Aníbal Costa
Anjan Dutta
Anna Brignola
Anne Kiremidjian
António Arêde
Antonio Figueiredo
António Gago
António Viana da Fonseca
Antonios Pomonis
Armando Aguilar
Armen Kiureghian
Artur Vieira Pinto
Arturo Tena-Colunga

TABLE OF CONTENTS

VOLUME 1

How Effective Are EC8 and Recommended AASHTO-LRFD Criteria for Regular Seismic Behavior of Ductile Bridges with Unequal Height Piers?	1
<i>Joseph Guirguis, Sameh Mehanny</i>	
Shake Table Acceleration Tracking Performance Impact on Dynamic Similitude Preliminary Findings	11
<i>Mike Mota, Franklin Moon, Ahmet Emin Aktan</i>	
Proposing the Optimized Combination of Different Isolation Bearings Subjected to Near-Fault Ground Motions	21
<i>Seyed Rohollah Hoseini Vaez, Hosein Naderpour, S. M. Kalantari, P. Fakharian</i>	
Seismic Retrofit of Beams in Buildings for Flexure Using Concrete Jacketing	28
<i>V. T. Badari Narayanan, Amlan K. Sengupta, S. R. Satish Kumar</i>	
Recovering Displacements and Transients from Strong Motion Records Using the Wavelet Transform	38
<i>Andrew Chanerley, Nicholas A. Alexander</i>	
Improvement of Methods for Earthquake-induced Landslides Assessment	48
<i>Xiaoli Chen, B. J. Zhou, Qing Zhou, Hongliu Ran</i>	
Engineering Analysis of an Offshore Pipeline on an Escarpment in a Seismically Active Zone - A Case Study in the Caspian	57
<i>Tapan K Sen</i>	
Seismic Behaviour of Cross-Laminated Timber Structures	65
<i>Marjan Popovski, Erol Karacabeyli</i>	
Nonlinear Soil - Pile - Structure Interaction in Dynamic or Seismic Response	75
<i>Yingcai Han, S. T. Wang</i>	
Soil Amplification Based on Regressions for Costa Rica Dataset	85
<i>Victor Schmidt Diaz</i>	
Initial Stiffness of Reinforced Concrete Columns and Walls	94
<i>Bing Li</i>	
Influence of Superstructure Flexibility on Seismic Response Pile Foundation in Sand	104
<i>Vijay Kumar Kanaujia, Ramanathan Ayothiraman, Vasant Matsagar</i>	
Design, Testing and Strengthening of Soft Storey of Multi-storey Low Cost Housing in Indonesia with Precast Concrete Frame System	114
<i>Hari Nurjaman, Binsar Hariandja, Lutfi Faizal, Christ Marbun, Hasiholan Sidjabat, Ryanto Rivky, Sondang Simanjuntak, Prijasambada, Yosua Situmorang, A. K. Manik, Dedi Putra</i>	
The Cullman Ellipse as a Strategic Tool for Seismic Grading of Structural Configurations	124
<i>Mario Paparoni, Osdaly Paz, Oscar Peña, I. Carbonell</i>	
An Alternative Procedure for Seismic Analysis and Design of Tall Buildings	134
<i>Farzad Naeim, Lauren Carpenter, Tony Ghodsi, Gary Hart, Marshall Lew, Michael Mehrain, Thomas A. Sabol, J. W. Wallace</i>	
Shaking Table Tests of Steel Fiber Reinforced Concrete Walls for Housing	144
<i>Julian Carrillo, Sergio Alcocer, José A. Pincheira</i>	
Performance Indicators for Seismic Design of Concrete Walls for Housing	154
<i>Julian Carrillo, Sergio Alcocer</i>	
Seismic Response Effect of Shear Walls in Reducing Pounding Risk of Reinforced Concrete Buildings Subjected to Near-Fault Ground Motions	164
<i>Rui Barros, Seyed Mohammad Khatami</i>	
Comparing Effects of Openings in Concrete Shear Walls under Near-Fault Ground Motions	173
<i>Seyed Mohammad Khatami, Alireza Mortezaei, Rui Barros</i>	
Source Model of the 2010 Elazig Kovancilar Earthquake (M_w 6.1) for Broadband Ground Motion Simulation	183
<i>Mehmet Baykal, Hiroe Miyake, Toshiaki Yokoi</i>	
Implication of the Seismic Code on the Seismic Design of Bridges in Algeria	193
<i>Ait Belkacem Mounir, Bourahla Nouredine</i>	
Characteristics of Strong Motion Duration from the Wenchuan M_w 7.9 Earthquake	201
<i>Junju Xie, Zengping Wen, Xiaojun Li</i>	
A Consistent Cross-Border Seismic Hazard Model for Loss Estimation and Risk Management in Canada	211
<i>Paul Thenhaus, Kenneth W. Campbell, Nitin Gupta, David Smith, Mahmoud Khater</i>	
CANDU 6 Nuclear Power Plant: Reactor Building Floor Response Spectra Considering Seismic Wave Incoherency	221
<i>Ali Nour, Abdelhalim Cherfaoui, Vladimir Gocevski, Pierre Léger</i>	
Joint Panel Shear Yielding in Steel Moment	229
<i>Faramarz Rahiminia, Hisashi Namba</i>	
A Methodology for Documenting Housing Typologies in the Moderate-Severe Seismic Zones	239
<i>Murty Cvr, Durgesh C. Rai, Hari Kumar, Keya Mitra, Amit Bose, H. B. Kaushik, Arvind Jaiswal, Pradeep Kumar Ramancharla</i>	
Damage Characteristics of RC Bridge Columns with Interlocking Spirals under Combined Cyclic Loading Including Torsion	249
<i>Qian Li, Abdeldjelil Belarbi</i>	
On Detailing of Reinforced-Concrete Frame Structures for Robustness and for Earthquake Resistance	259
<i>Rina Farhat, Nicolae Gluck, Rami Eid, Uri Tzadka</i>	
Seismic Assessment of Innovative Hybrid Bracing System Equipped with Shape Memory Alloy	267
<i>Ali Jalaefar, Behruz Asgarian</i>	

Peak Ductility Demand of Mainshock-Aftershock Sequences for Japanese Earthquakes	276
<i>Katsuichiro Goda</i>	
Inelastic Behavior of Hollow Reinforced Concrete Bridge Columns	286
<i>Tae-Hoon Kim</i>	
The Economic Impact of Seismic Retrofit on Heritage Buildings with Historic Reinforced Concrete Skeleton Structure of the Interwar Time	292
<i>Maria Bostenaru Dan</i>	
Effect of Nearby Topography on Amplification of Seismic Motion in Topographic Irregularities: The Case of a Hilly Site in Tehran	302
<i>Mohammad Khandan Bakavoli, Ebrahim Haghshenas, Jafar Bolouri Bazaz, Majid Khandan Bakavoli</i>	
Inelastic Response of 3D RC Frames of a Urban Viaduct Considering the Interaction Soil-Structure Effect by Numerical Simulation	312
<i>Hector Sánchez Sánchez, Edgar Lugo Espino, Carlos Cortés Salas</i>	
Multi-Phase Passive Control Systems for Performance-Based Design	322
<i>Taylor Rawlinson, Justin Marshall</i>	
High Rise Building Retrofitting in a High Risk Earthquake Zone	332
<i>Kumars Zand-Parsa</i>	
How Important Are the New Factors in the Recent Earthquake Code for Concrete Structures	337
<i>Kumars Zandparsa</i>	
Inter-Period Correlation of Acceleration Response Spectra in Observed and Simulated Ground Motions	347
<i>Tatsuya Itoi, Tsuyoshi Takada</i>	
Conditional Simulation of Spatially Incoherent Seismic Ground Motion Using Gaussian Process Models	357
<i>Irmela Zentner</i>	
Seismic Retrofitting of Moment-Resisting Connections Using Beam Web Opening	364
<i>Ardeshir Deylami, Mahdteh Aminifar</i>	
Vertical Seismic Isolated Structures with Semi-Active Control System	372
<i>Masoud Nekooei, Mansour Ziyaeifar</i>	
Seismic Response of Single-story Steel Moment Frame with Isolated Floor System	380
<i>Yuji Koetaka, Keita Matsumoto, Yasushi Yano</i>	
The Mw=9.0 Tohoku Japan Earthquake (March 11, 2011) Tsunami Impact on Structures and Infrastructure	390
<i>Efthymis Lekkas, Emmanuël Andreadakis, Vassiliki Alexoudi, Eleni Kapourani, Irene Kostaki</i>	
Added Mass Model for Vertical Circular Cylinder Partially Immersed in Water	399
<i>Enrico Da Lozzo, Ferdinando Auricchio, Gian Michele Calvi</i>	
Development of Artificial Earthquake Records in the Philippines using Specific Barrier Model Considering Local Site Conditions	409
<i>Darell James Mendoza, Eric Augustus Tingatinga</i>	
Experimental Study of Semi-Active Device as Active Interaction Control Device	418
<i>Ming-Hsiang Shih, Wen-Pei Sung</i>	
Predictive Safe Control of Non-Linear Seismic Response of Building Frames Using Neuro-Modal Controllers	428
<i>Mallikharjuna Rao Manepalli, Tushar Kanti Datta</i>	
Empirical Approach Using ANN for Determining Confined Compressive Strength in FRP-Strengthened Concrete Members	438
<i>Hosein Naderpour</i>	
Estimation of Strong Motion During the 2011 Northern Nagano Earthquake and an Associated Building Damage Survey	448
<i>Masumi Yamada, Masayuki Yamada, Yui Fukuda, Yoshinori Fujino, Koji Hada, Christine Smyth,</i>	
Optimum Automated Direct Displacement Based Design of Reinforced Concrete Frames	458
<i>Ali Fakhreddini, Javad Salajegheh</i>	
Local Site Effect and Microzonation in Assessing and Managing Earthquake Risk	467
<i>D. Shanker, H. N. Singh, A. Kumar, V. N. Neelakandan, V. S. Kumar</i>	
Design of Base Isolated Buildings Built Right Above a Fault	474
<i>Takao Nishizawa, Kazuhiro Yoshihara, Nobuo Fukuwa, Yasuhiro Suzuki</i>	
Dynamic Behavior of Puebla City Cathedral	484
<i>J. C. Ramirez-Cisneros, J. Lozano, H. O. Ferrer-Toledo, J. Rojas-Palacios, R. Vázquez-Rosas, H. Mijares-Arellano</i>	
A Hybrid Empirical-Stochastic Method for Ground Motion Simulation; a Sample Study: The 22 February 2005 (MW 6.4) Zarand (Central Iran) Earthquake	494
<i>Hamid Zafarani</i>	
An Experimental and Analytical Study in Reinforced Concrete Frames with Weak Beam-Column Joints	502
<i>Beyhan Bayhan, J. P. Moehle, Soheil Yavari, K. J. Elwood, S. H. Lin, C. L. Wu, S. J. Hwang</i>	
The Use of Continuum Models for Analyzing Adobe Structures	512
<i>Nicola Tarque Ruiz, Guido Camata, Enrico Spacone, Marcial Blondet, Humberto Varum</i>	
Exact Stiffness and Frequency Relationships for a Doubly Asymmetric Bending-Torsion Thin-Walled Beam	522
<i>Aida Azari Sisi, Behzad Rafezy, Paul Howson</i>	
Seismic Retrofitting Effects of Reinforcing Over-Track Buildings with Knee-Brace Dampers	532
<i>Seiji Yamada, Katsuyuki Shimizu, Yasushi Takei</i>	
Damage Indices using Energy Criterion for Seismic Evaluation of Steel Frame Buildings	542
<i>Prahlad Prasad, Manish Shrikhande, Pankaj Agarwal</i>	
Number of Yield Excursion Cycles Versus Performance Based Seismic Design	552
<i>Prasad Prahlad, Shrikhande Manish, Agarwal Pankaj</i>	

A Study on the Correlation Between Dissipated Hysteretic Energy and Seismic Performance	562
<i>Athanasia Kazantzi, Dimitrios Vamvatsikos</i>	
Response Control Effect of Steel Building Structure Using Tuned Viscous Mass Damper	572
<i>Yoshifumi Sugimura, Wataru Goto, Hirokazu Tanizawa, Kenjiro Saito, Toshiyumi Ninomiya, Tomoya Nagasaki, Kenji Saito</i>	
EEFIT Field Observations and Lessons from the 11th March 2011 Mw9.0 Tohoku Earthquake: Ground Motion and Shaking Damage	582
<i>Katsuchihiro Goda, Siaw Chen Chian, Stuart Fraser, Joshua Macabuag, Mark Offord, Antonios Pomonis, Keiko Saito, Alison Raby, Peter Sammonds</i>	
Inclusion Effect on Heterogeneity of Excess Pore Water Pressure Distribution in Composite Clay	592
<i>Javad Jalili, Mohammad Kazem Jafari, Ali Shafiee</i>	
An Exploration on Characteristics of Ground Motion Containing Harmonic Waves	602
<i>Longjun Xu, Yujian Xie, Lili Xie</i>	
Magnitude-Recurrence Relationship and its Effect on Uniform Hazard Spectra: A Current Assessment	612
<i>Tapan K Sen</i>	
Evaluation of Site Effects: Development of the Semiquantitative Abacuses in Lazio Region (Italy)	620
<i>Florian Pergalani, Massimo Compagnoni, Antonio Colombi</i>	
Structural Performance of Damaged Open-web Type SRC Beam-columns after Retrofitting	630
<i>Takashi Fujinaga, Yuping Sun</i>	
Response Modification Factor of Dual Moment-resistant Frame with Buckling Restrained Brace (BRB)	638
<i>Gholamreza Abdollahzadeh, Mohammad Reza Banihashemi, Sdegh Elkaee, Mojtaba Esmaeelinia Amiri</i>	
Structural Pounding Between Adjacent Buildings: The Effects of Different Structures Configurations and Multiple Earthquakes	648
<i>Sofia Efraimiadou, George Hatzigeorgiou, Dimitri Beskos</i>	
Strong Ground Motion Signal Selection Consistent with Local Seismic Hazard Levels. Applications in 3 Cities in Colombia	658
<i>Mario Andres Salgado, Daniela Zuloaga, Gabriel Andres Bernal, Luis Eduardo Yamin, Omar Cardona</i>	
The Ground Motion Attenuation Relation for the Mountainous Area in Sichuan and Yunnan	668
<i>Jianwen Cui, Jianguo Zhang, Dong Gao, Jianxin Duan, Tun Wang</i>	
Structural Control for Asymmetric Buildings Subjected to Earthquake Excitations	678
<i>Nikos Pnevmatikos</i>	
Repair of Damaged Circular Reinforced Concrete Columns By Plastic Hinge Relocation	688
<i>Stephen Rutledge, Mervyn J. Kowalsky, Rudolf Seracino, James M. Nau</i>	
Design of FRP Jackets for Confinement of Plastic Hinges in Reinforced Concrete Columns using Displacement Ductility	698
<i>Chris Pantelides, Domingo Moran</i>	
Experimental Investigations on the Seismic Performance of Un-Retrofitted and Retrofitted RC Frames	708
<i>Feng Liu, Lai Wang, Xilin Lu</i>	
A New Procedure for Selection and Modification of Strong Ground Motion for Nonlinear Dynamic Analysis	715
<i>Mohammad Nooraie, Farhad Behnamfar</i>	
Experimental Investigation on the Health Monitoring of Fluid Dampers for Bridges	725
<i>Dimitrios Konstantinidis, Nicos Makris, James M. Kelly</i>	
Preliminary Analysis of Doubler Plate Attachment Details for Steel Moment Frames	735
<i>Priyanka Shirsat, Michael Engelhardt</i>	
Calibration of a Source Spectrum Model and Construction of Spectral Strong Motion Attenuation Relationships from Accelerogram Records	745
<i>G. A. Bernal, Mario G. Ordaz, Mario Andrés Salgado, Luis Eduardo Yamin, Omar Cardona</i>	
Design and Elastic Behaviour Influence of Recycled RC Buildings Subjected to Earthquakes	752
<i>M. C. Gómez-Soberón, O. Santillán-Nieves, J Manuel Gómez-Soberón, Luis A Gómez-Soberón</i>	
Evaluation of Seismic Torsional Response of Base Isolated Buildings	762
<i>Kazushi Shimazaki</i>	
Earthquake Performance of Non-engineered Construction in Nicaragua	772
<i>Lisa Holliday, Thomas Kang</i>	
Seismic Displacement Demands of Reinforced Concrete Structures by Cyclic Pushover Analysis	782
<i>Phaiboon Panyakapo</i>	
Experimental Study on Confined Brick Masonry in Indonesia	792
<i>Tatsuo Narafu, Hiroshi Imai, Yuji Ishiyama, Dyah Kusumastuti, Wahyu Wuryanti, Kazushi Shirakawa, Makoto Kinoshita</i>	
Collapse Simulation for a Super-Tall Mega-braced Frame Core-tube Building	802
<i>Wan-Kai Zhang, Xiao Lu, Xin-Zheng Lu, Lie-Ping Ye, Jia-Ru Qian</i>	

VOLUME 2

Development of Fragility Curves for Retrofitted Multi-column Bridge Bent Subjected to Near Fault Ground Motion	812
<i>Ahm Muntasir Billah, M. Shahria Alam</i>	
V_{S30} – A Site-Characterization Parameter for Use in Building Codes, Simplified Earthquake Resistant Design, GMPEs, and ShakeMaps	822
<i>Roger Borcherdt</i>	
Development of Seismic Damage Estimation Index for Service Lines with Seismic Resistant Spring	832
<i>Daisuke Takabatake, Yoshiharu Shumuta, Takashi Miyako</i>	

Evaluation of Maximum Velocity for Inelastic Structures with Supplementary Dampers	842
<i>George Hatzigeorgiou, George Papagiannopoulos</i>	
Progress Report on the Technical Development of the 2014 NEHRP Recommended Seismic Provisions	850
<i>David Bonneville</i>	
“Soft Story” and “Weak Story” in Earthquake Resistant Design: A Multidisciplinary Approach	856
<i>L. Teresa Guevara-Perez</i>	
Seismic Performance of Steel Bridge Piers Containing Composite Connections	866
<i>Steven Fulmer, Mervyn J. Kowalsky, James M. Nau</i>	
Ultimate Strength and Restoring Force Characteristics of Unembedded Type Column Bases in Steel-Concrete Composite Structures	876
<i>Kazushi Sadasue, Katsuya Akamatsu, Koichi Minami</i>	
The Selection and Scaling of Ground Motion Records for Great Scenario Earthquakes Based on the Condition Mean Spectrum	884
<i>Li Lin, Wen Ruizhi, Zhou Baofeng, Shi Dacheng</i>	
Full-Scale Shaking Table Tests of XLaM Panel Systems - Correlation with Cyclic Quasi-Static Tests	894
<i>Viktor Hristovski, Marta Stojmanovska, Bruno Dujic</i>	
A Sensitivity Analysis of Amplification Factor of Peak Ground Acceleration by Means of Neural Network and Time History Analysis: A Case Study	904
<i>Mojtaba Heidari, Meisam Heidari</i>	
The Mw 7.1 Sept 4 2010 and Mw 6.3 Febr 22 2011, New Zealand Eqs. Comparison of EMS₁₉₉₈ and ESI₂₀₀₇ Data	910
<i>Panagiotis Carydis, Efthymis Lekkas, Theodosios Kritikos</i>	
Influence of Additional Attenuation of Small Strain Shear Modulus G_{max} on Site Seismic Response	920
<i>B. Huang, L. Li, Dao-Sheng Ling, M. X. Shi</i>	
Auto-Parametric Stability and Post-Critical Behavior of a Non-Linear Continuous System Under Random Seismic Excitation	930
<i>Jiri Naprstek, Cyril Fischer</i>	
Seismic Assessment of Historical Brick-Masonry Buildings in Vienna	940
<i>Christoph Adam, Thomas Furtmüller, Günther Achs</i>	
Modeling Nonstructural Damage for Metropolitan Building Stocks	950
<i>Steven French</i>	
Comparison of the Seismic Performance of Equivalent Straight and Curved Bridges due to Transverse Seismic Excitation	960
<i>Easa Khan, Mervyn J. Kowalsky, James M. Nau</i>	
Determination of Site Amplification in East-Central Iran from Inversion of Strong-Motion Records	970
<i>Behzad Hassani, Hamid Zafarani, Jamshid Farjoodi</i>	
Experimental Study of the Behaviour of a New Replaceable Bracing System (BBBS)	979
<i>S. Vahid Khonsari, Mahmoud Moradi, Dawoud Zarei, Hossein Farahani, George L. England</i>	
Experimental Study of a New Steel Shear Wall with an Embedded Special Damping Mechanism (SSWAF)	989
<i>S. Vahid Khonsari, Hamed Seyf, Saman Mehryar, M. Shahsavari-Gargari</i>	
Experimental Investigation into the Behaviour of a Beam-to-Column Connection with Improved Initial Stiffness	999
<i>S. Vahid Khonsari, Soorena Poorzandpoosh, M. Shahsavari-Gargari</i>	
Response of Degrading Reinforced Concrete Systems Subjected to Replicate Earthquake Ground Motions	1008

4. CONCLUSIONS

The three-dimensional parallel finite element algorithm has been successfully applied to analyze the cause of the damaged of the waterfront structures in the Port of Kobe during Hyogo-Ken Nanbu earthquake, 1995. A good agreement was achieved when the calculated large movements of the quay walls in this analytical study are compared to the field observation results after Hyogo-Ken Nanbu earthquake, 1995. Based on this analytical study may be concluded that the progressive failure of the quay walls were initially caused by increasing the pore water pressure which is induced by multi-directional shear stress in the saturated soil layer beneath the quay walls. Increasing the pore water pressure, then reduce the frictional resistance on the beneath of the quay walls, makes the quay walls are easy move by their inertia force. Simultaneous lateral movement and base excitation build up high excess pore water pressure and consequently reduce the effective stress in the saturated soil layers, which mean the saturated soil layers loss their bearing capacity.

SUMMARY:

This paper is concerned on the analyzing of large deformation of the waterfront structures, i.e. gravity caisson quay wall type, on the Port of Kobe by using three-dimensional nonlinear parallel finite element method. The analytical results of a corner part of the Port of Kobe show that the multi-directional shear increases the pore water pressure excessively and, consequently, reduces the frictional resistance on the beneath of the walls. Reducing frictional resistance at the beneath of the walls makes the walls easily to move due to inertia forces acting in the quay walls. As the quay walls move toward the seawater area, the backfill soils then fail and the stiffness of the soil layer was reduced. As a consequence, the pore water pressure was increased. The sequence of the quay walls movement was affected by the pore water pressure responding in an isotropic manner, which is effectively inspected by the three-dimensional analysis.

Keywords: 3D nonlinear FEM, parallel computation, saturated soil layers-civil structure interaction problem

1. INTRODUCTION

The gravity caisson quay walls structures construct as the waterfront structure in the port area often damage during great earthquake. The example is most of quay walls constructed in the Port of Kobe were damaged by the Hyogo-ken Nanbu earthquake on January 17th, 1995. These quay wall structures were moved laterally toward the seawater area and settled in a few meters (Madabhushi, 1995, Ministry of Transport, 1997). The damaged of these waterfront structures are indicating the complexity of the interaction problem between the saturated soil layers and the civil structures. The source of complexity comes from the dynamic response of the saturated soil layers where the soil grains and the pore water interacts each other. An accurate estimation of the dynamic responses of the quay wall and the saturated soil layers behind and beneath of the quay walls, including their interaction, is required to know the causes of the damage of the port facilities such as is located in the Port Island, Kobe.

Analyzing the complex interaction problem such as is mentioned above by using three-dimensional finite element method over large interest domain on a single processor machine, however, often exceeds the available computer capacity. The parallel computation algorithm based on the Domain Decomposition Method has been developed by authors to overcome its limitation (Kawamura and Tanjung, 2002 and Tanjung, 2010). For a case of study, a corner part of Port of Kobe was analyzed and the analytical results were compared to field observation of the damaged of quay walls on the Port of Kobe after Hyogo-Ken Nanbu earthquake, 1995.

2. PARALLEL FINITE ELEMENT MODEL AND ITS NUMERICAL SOLUTION

Port of Kobe is located in artificial island of Port Island, Kobe, Japan. The island was constructed within period of 1966 and 1981 for the first stage, and the second stage was started to reclaim in 1986.

Up to now about 755 ha of the port area have been reclaimed (Yang, 2000). The reclaimed land is contained several layers decomposing of the soils and the stones. The blocks of gravity caisson type of quay wall were constructed as waterfront structures. For an analytical study purpose, a corner part of the Port of Kobe, as shown as dark area in Figure 1, has been chosen as the finite element model. The dimensions of the finite element model are 276 meters long, 240 meters wide and 48 meters depth. The model was meshed into more than 12000 of 8-node brick isoparametric elements and resulting more than 50000 degrees of unknowns. The model was partitioned into 14 subdomains and was solved by using 14 individual processors in the SGI Origin/2000 machine. Partitioning of the meshed model is shown in Figure 2.

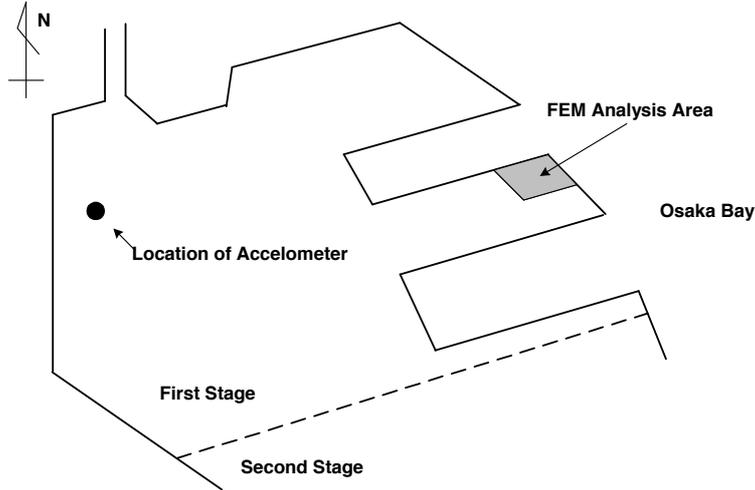

Figure 1. Site Map of Port Island, Kobe

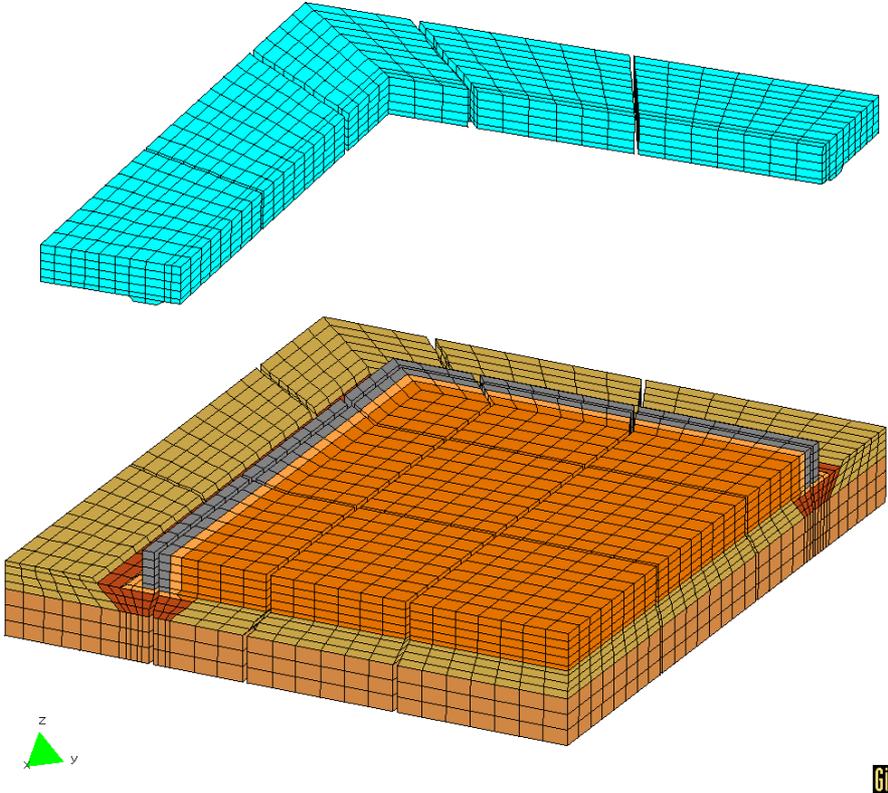

Figure 2. Mesh Partition of Finite Element Model

In this finite element model, the gravity caisson quay walls were treated as an equivalent homogenous

solid material and stress-strain relation was assumed to follow the linear elastic response with small strain amplitudes. The material properties for the gravity caisson quay walls are given in Table 1. The soil layers behind and below the quay walls were idealized as a two-phase system coupling of the soil skeleton and the pore water. The stress strain relation for the soil skeleton was represented by the simplification of the bounding surface plasticity model. Detail formulation of its plasticity model has been described by authors in references Kawamura and Tanjung (2002) and Tanjung (2010). This simplified bounding surface plasticity model has 8 parameters to be determined for a particular soil type. These parameters defining the soil layer properties were determined using the standard tests results as were reported Ministry of Transport (1997) for the soil layers located in the Port Island. These parameters, furthermore, were compared to the works of Been (1991) and Wolf-Crouch (1994). The values of these parameters are tabulated in Table 2 for the soil layers marked in the circled number shown in the cross section of the finite element model in Figure 3.

The joint surface elements, i.e. two-dimensional isoparametric element, were introduced to represent the interaction between quay walls and the soil layers. The joint surface elements were also placed between the soil layers as interfaces between these soil layers. Formulation of this joint surface element was derived based on worked of Beer (1985) and Toki (1981) to represent the traction force and relative displacement behaviour on the surface of the joint surface element. This traction force and the relative displacement are evaluated in the normal and tangential directions to the surface of the joint surface element. The parameters for defining the joint surface element properties were collected from several sources such as were reported by Beer (1995), Toki (1981) and Hazarika and Matsuzawa (1997). The values of these parameters are listed in Table 3 for the joint surface element in the boxed number in Figure 3.

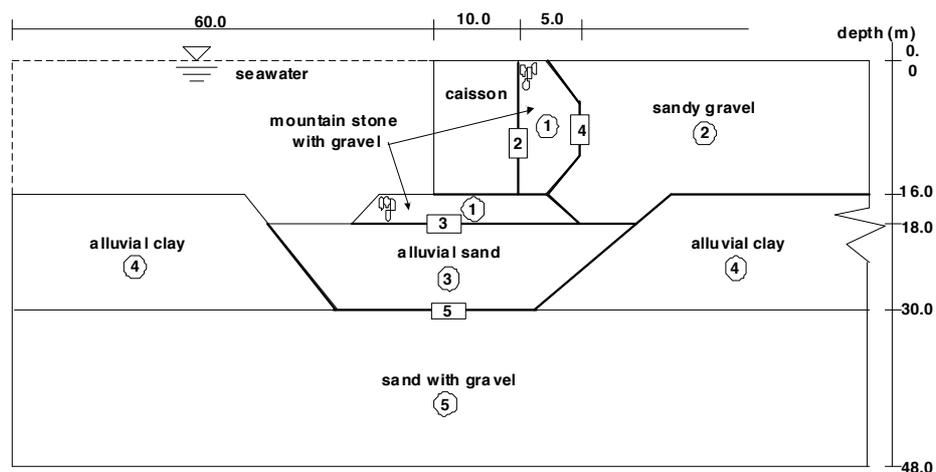

Figure 3. Typical Cross-section of the Finite Element Model

For the seawater, the hydrodynamic affect was approached by considering the displacement the seawater as the unknown as was proposed by Wilson and Mehdi (1983). The equation of motion for the seawater was derived based on the total fluid energy of the fluid movement, the potential energy on the surface wave and the kinematics energy affected by velocity of the wave. In their proposed method, the fluid strain energy is considered based on the linear strain-displacement relation and associated with the compressibility of the fluid. The method involves the introduction of the 'constrain' of zero fluid rotation at the integration point of a fluid element. To eliminate an increment of the fluid stiffness due to high order integration, the method uses reduced integration point to produce a single element fluid 'stiffness' matrix. Finally, the method has been become easily suited into developed parallel finite element code, since the displacement of the seawater was treated as the unknown in the equation of motion of the seawater domain. The material properties for the seawater elements are only bulk modulus of the water K_f and a non-dimensional multiplier constant for defining the rotational bulk modulus of the water α_r . A value of bulk modulus of the water K_f was taken as 2.08×10^6 kN/m² and a value of α_r has been recommended by Wilson and Mehdi (1983) as 100.

Except for the upper surface of the model, both of soil skeleton and the pore water were not allowed to move outward on the boundaries of the model. The pore water pressures on the upper surface of the model were kept equal to zero during the analysis. The surface wave of the seawater was enforced by their potential energy such that the hydrodynamic pressures remain constant even for large vertical movement. The model was subjected to three components of ground motion recorded by an accelerometer at the depth of 48 meters below the surface of the Port Island. A location of the accelerometer is marked as a filled circle in Figure 1. The accelerations of these ground motions are plotted in Figure 4.

Table 1. Material Properties of Caisson Quay Wall

Property	Symbol	Unit	
Elastic Shear Modulus	G	kN/m ²	2.6 x 10 ⁶
Poisson's Ratio	ν		0.25
Density	ρ_d	kN/m ³	17.0

Table 2. Material Properties of Soil Layers

Property	Symbol	Unit	Layer 1	Layer 2	Layer 3	Layer 4	Layer 5
Effective frictional angle	ϕ_{cr}	degree	33	31	32	38	35
Slope of isotropic consolidation line	λ		0.035	0.06	0.02	0.25	0.13
Slope of elastic rebound line	κ		0.004	0.0021	0.0026	0.05	0.015
Parameter of shape of elliptic	R		2.25	2.25	2.25	2.25	2.25
Elastic nucleus factor	s_e		1.0	1.0	1.0	1.0	1.0
Hardening shape factor	h_{c1}/h_{c2}		0.1/0.001	0.03/0.002	0.03/0.001	0.04/0.1	0.03/0.1
	h_{e1}/h_{e2}		0.1/0.001	0.03/0.002	0.03/0.001	0.04/0.1	0.03/0.1
Initial void ratio	e_{in}		0.5	0.35	0.392	1.4	0.5
Poisson's ratio	ν		0.25	0.32	0.342	0.33	0.334
Bulk modulus of granular soil	K_g	kN/m ²	4.0 x 10 ⁷	4.0 x 10 ⁷	3.7 x 10 ⁷	2.3 x 10 ⁷	3.8 x 10 ⁷
Bulk modulus of water	K_f	kN/m ²	2.08 x 10 ⁶	2.08 x 10 ⁶	2.08 x 10 ⁶	2.08 x 10 ⁶	2.08 x 10 ⁶
Density of saturated soil	ρ	kN/m ³	27.0	26.0	23.0	27.0	26.0
Density of water	ρ_f	kN/m ³	10.0	10.0	10.0	10.0	10.0
Coefficient of permeability	k	m/s	1.0 x 10 ⁻²	1.0 x 10 ⁻²	1.2 x 10 ⁻³	1.2 x 10 ⁻⁷	7.0 x 10 ⁻⁵

Table 3. Material Properties of Joint Surface Elements

Property	Symbol	Unit	Surface 1	Surface 2	Surface 3	Surface 4	Surface 5
Normal Stiffness	k_n	kN/m ³	1.0 x 10 ⁷	1.0 x 10 ⁶	1.0 x 10 ⁶	1.0 x 10 ⁶	1.0 x 10 ⁶
Shear Stiffness	K_s	kN/m ³	2.5 x 10 ³	1.6 x 10 ⁴	1.2 x 10 ⁵	1.2 x 10 ⁵	0.75 x 10 ⁴
Friction Angle	ϕ	degree	38	35	35	35	36
Hardening Parameter	h		0.0001	0.01	0.01	0.01	0.01

The numerical solution of the equation of motion in current parallel finite element was obtained by integrating the equation using Hilber- α method in time domain with constant time step of 0.005 second, 15 seconds time excitation, damping ratio 5% and Hilber- α parameter -0.25. The iterative procedures of the modified Newton-Raphson method were applied to solve the nonlinear responses on each time step. Indeed, in the parallel finite element algorithms, the analysis was conducted by allocating the blocks of the computations into several individual processors and most of these computations were performed in the subdomain basis without interprocessor communication. The Domain Decomposition Method was used to partite the whole domain of the analytical model into several non-overlapping subdomains. The continuity condition on interface of subdomains was enforced by introducing the traction forces on these interfaces and was iteratively solved by using the Conjugate Gradient method. The interprocessor communication such that the data can be exchanged

from one processor to others, was taking apart when solving this continuity condition. In fact the exchanged data significantly affects the parallel computing performance, since the interprocessor communication will delay the calculation works during analysis. To overcome this situation, the interprocessor communication based on the hypercube networking was applied in this study (Kawamura and Tanjung, 2002 and Tanjung, 2010).

3. ANALYTICAL RESULTS AND DISCUSSION

Figure 5 shows the computed deformation of finite element model subjected to multi directions ground motion of the Hyogo-Ken Nanbu earthquake, 1995. The typical lateral movement and settlement time history for north and east side of the gravity caisson quay walls are plotted in Figure 6. These graphs

are plotted based on the responses of quay walls on the nodes A and B as are shown in Figure 5. The negative values of the lateral movement and the settlement correspond with the displacements toward the seawater and downward, respectively.

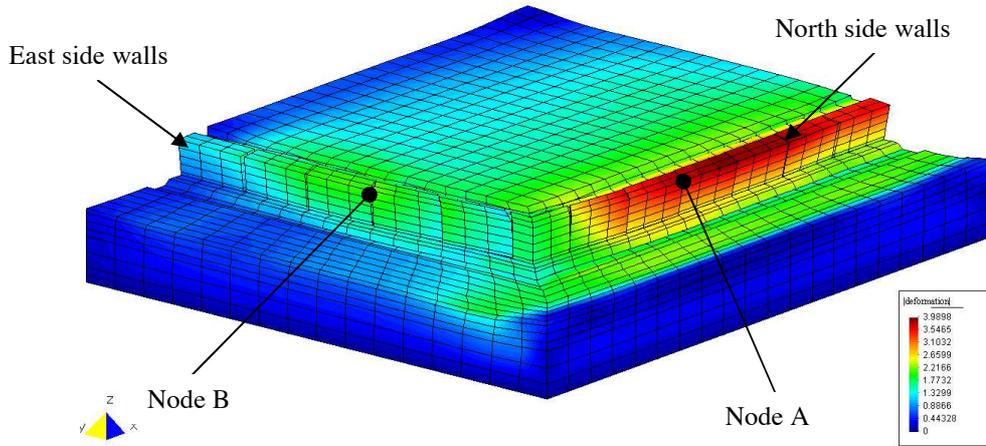

Figure 5. Deformation of the Finite Element Model after 10 seconds Excitation

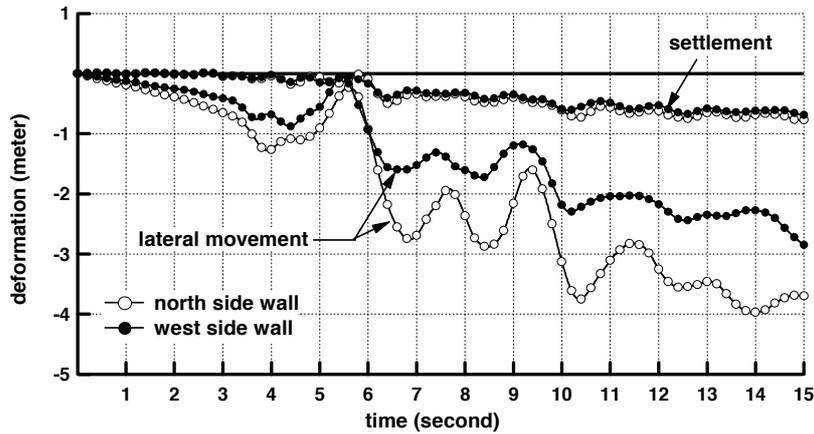

Figure 6. Lateral Movement and Settlement Time History of the Gravity Caisson Quay Walls

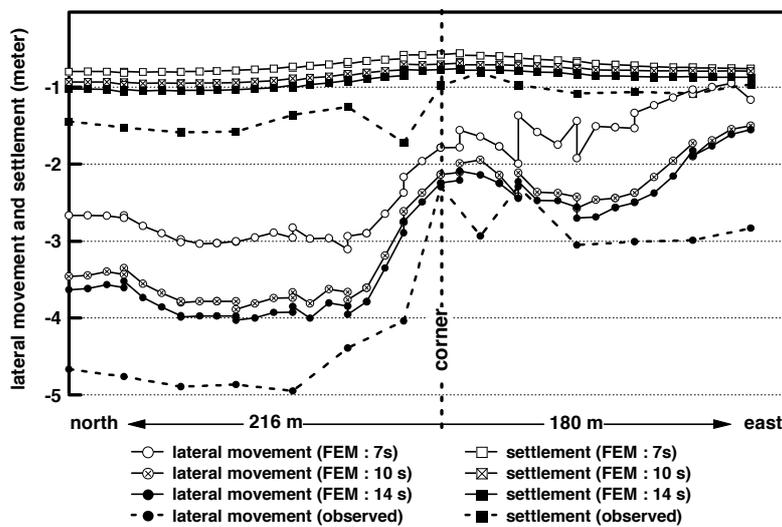

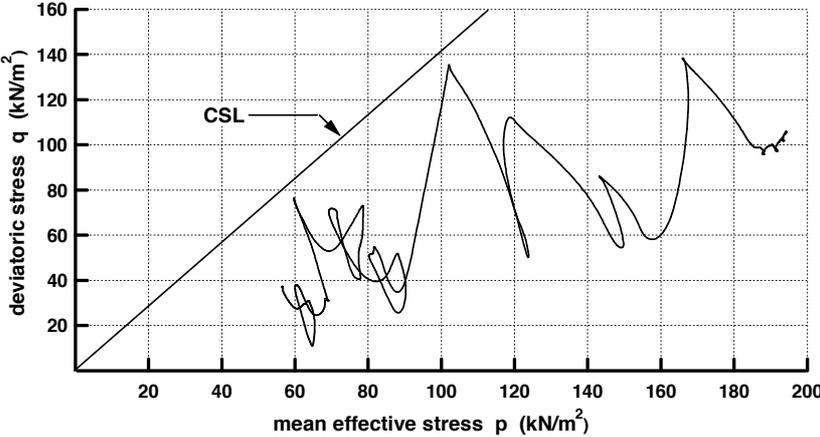

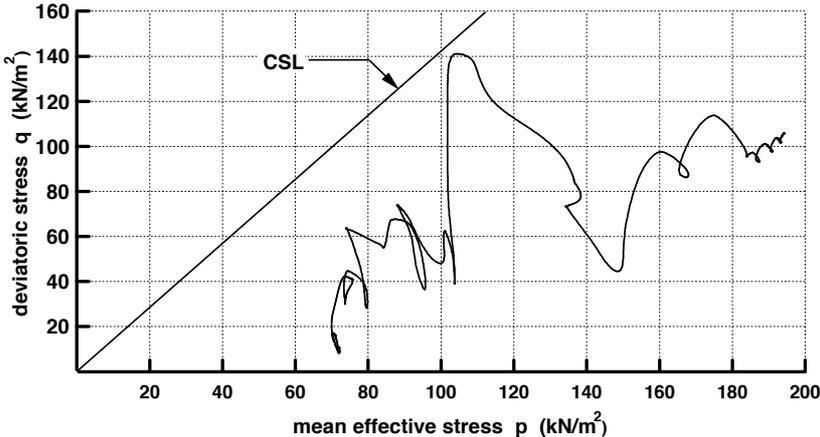

Figure 7. Sequence of Lateral Movement and Settlement of the Quay Walls

The maximum lateral movement of the walls on the north and east sides are about four meters and about three meters, respectively and the settlement is less than one meter. A good agreement has been obtained when the analytical results in this study are compared to the field observation of movements of quay walls after Hyogo-Ken Nanbu earthquake, reported by Ministry of Transport (1997), on the Port of Kobe. The comparison of these results is plotted in Figure 7. The field observation had shown that the lateral movement on the north and east sides about five meters and three meters, respectively, and settlements about one and half meters and one meter, respectively.

Figure 8. The Effective Stress Path, (a) Beneath North Wall (b) Beneath East Wall

The concurrent of the large movements of the quay walls are begin after 5 seconds excitation. Multi-directional base excitation induces the multi-directional shear stress in the saturated soil layers and increasing the pore water pressure excessively. As the consequently, the frictional resistance on the beneath of the quay walls becomes reducing. The reduction of the frictional resistance on the beneath of quay walls after 5 seconds excitation makes the quay walls easily to move due to the inertia forces in the quay walls. When the quay walls start to move, the progressive failure of the quay walls is begun. Lateral movement of the quay walls and base excitation causes the pore water pressure significantly increasing in isotropic manner and at the same time the stiffness of the saturated soil layers are reducing. Reduction of the stiffness of these saturated layers makes the saturated soil layers loss their bearing capacity, especially at the beneath of the quay walls. Reduction of the stiffness the saturated soil layers are clearly shown in the effective stress path beneath of the quay walls in Figure 8, i.e. the mean effective stress significantly reduces and the deviatoric stress going to critical state line.

4. CONCLUSIONS

The three-dimensional parallel finite element algorithm has been successfully applied to analyze the cause of the damaged of the waterfront structures in the Port of Kobe during Hyogo-Ken Nanbu earthquake, 1995. A good agreement was achieved when the calculated large movements of the quay walls in this analytical study are compared to the field observation results after Hyogo-Ken Nanbu earthquake, 1995. Based on this analytical study may be concluded that the progressive failure of the quay walls were initially caused by increasing the pore water pressure which is induced by multi-directional shear stress in the saturated soil layer beneath the quay walls. Increasing the pore water pressure, then reduce the frictional resistance on the beneath of the quay walls, makes the quay walls are easy move by their inertia force. Simultaneous lateral movement and base excitation build up high excess pore water pressure and consequently reduce the effective stress in the saturated soil layers, which mean the saturated soil layers loss their bearing capacity.
