11. Dr. Anu Sharma (Associate Prof) Dept of Anatomy, DMCH, Ludhiana (PB)

1 "Indian Journal of Forensic Medicine & Toxicology" is peer reviewed six monthly journal. It deals with Forensic Medicine, Forensic Science, Toxicology, DNA fingerprinting, sexual medicine and environment medicine. It has been assigned international standard serial No. p-0973-9122 and e- 0973-9136. The Journal has been assigned RNI No. DELING/2009/1789. The journal is indexed with Index Copernicus (Poland) and is covered by EMSASE (Excerpta Medica Database). The journal is also abstracted in Chemical Abstracts (CAS) database (USA). The journal is also covered by EBSCO (USA) database. The Journal is now part of UGC, DST and CSR Consortia. It is now official publication of Indian Association of Medico-Legal Experts (Regd.).

ABSTRACT

Background: This paper discusses palatal rugae patterns and their contribution in the identification of individuals and the determination of family lineage in West Sumatera, Indonesia. Identifying an individual is a prerequisite for the issuance of death certificate as well as for personal, social and legal reasons. The most common techniques used in this context are dental records, fingerprint and DNA comparisons. However, under certain circumstances, these cannot always be used. But interestingly, palatal rugae patterns are preservable because they are impervious to disasters and hostile conditions and can be used as alternative human identification techniques. This paper argues that the study of palatal rugae (rugoscopy) cannot only help to reveal a person's identity but also to determine their family lineage.

Objective: The present study was carried out to ascertain whether there is any hereditary patterns in the palatal rugae patterns of the mother, father, and the offspring in one family.

Method: This is a cross sectional study of 48 samples consisting of 12 families in *Luhak Nan Tigo*. The parents and offspring (son or daughter) of each family were randomly selected. Palatal rugae impression was recorded using alginate while palatal rugae patterns were noted and recorded. *One Way ANOVA* test (SPSS 17) was used as statistical analysis method.

Result: The study shows that there is a significant similarity in curved, wavy, and straight rugae patterns ($p > 0.05$) as well as in primary, secondary, and fragmented rugae based on the family tie between the father, mother, sons and daughters of the *Minangkabau* ethnic. Unilateral and circular rugae tests are insignificant ($p < 0.05$).

Conclusion: This is a cross sectional study whose results are only based on 48 samples consisting of 12 families, therefore further studies are needed with a larger sample quantity. The results of this study indicate the role of factors in the patterns of palatal rugae.

Keyword: Palatal Rugae, Pattern Identification, Minangkabau Family Lineage.

INTRODUCTION

In the last decades, Indonesia has dealt with more than 400 natural disasters of which floods, fires,

typhoons and landslides are the most common. In addition to this, disasters such as earthquakes, tsunamis and volcano eruptions also occur on a yearly basis.¹ These natural disasters have caused the death of ten of thousand people in West Sumatran, one of the disaster-prone areas in Indonesia. Sadly however, many of these victims had not been identified due to lack of financial or material means to conduct identification procedures. Identifying an individual is a prerequisite for the issuance

Corresponding author:

of their death certificate and for personal, social and legal reasons. In forensic, the main methods of human identification used are the DNA test, retina, fingerprints and dental characteristics. However, many of these methods may not be totally effective or conclusive.² Hence the need for the study of palatal rugae as an alternative method for the scientific identification of individuals. Forensic odontology has played a key role in the identification of persons in mass disasters, crime investigations, ethnic studies, and in the identification of decomposed and disfigured bodies like that of drowned persons, fire victims, and victims of motor vehicle accidents.³ The various methods employed in forensic odontology include rugoscopy, cheiloscopy, bite marks, tooth prints, radiographs, photographic study, and molecular methods. When these methods of identification are unavailable, rugae may be considered as an alternative source of information to facilitate the identification process.² There are several classifications of palatal rugae. But the most frequent used is the classification given by Thomas and Kotze,² which classifies Palatal rugae in three categories based on their length: Primary rugae (more than 5 mm in length), secondary rugae (3-5 mm in length) and fragmented rugae (<2 mm in length). The patterns of the rugae are classified into curved, wavy, straight and circular types. Straight patterns have a direct course from the point of origin to their insertion in a straight line. Curved patterns have a crescent shaped pattern with a mild curvature. Wavy rugae are serpentine in shape. Rugae with specific continuous ring type morphology are classified as circular. Unified rugae are united either in their origin or in their insertion giving a forked appearance. These are the patterns involved in this study conducted to assess the association of palatal rugae patterns among family members of the *Minangkabau*, a subgroup of the *Deutro Malay* ethnic, which consist of *Aceh, Malay, Minahasa, Bugis, Makassar, Sasak, Bali, Java, and Minangkabau*.³

Method

This research was conducted in *Luhak Nan Tigo* located at *Guguhak, Situjuh, and Tanjung* Sub-districts in the District of *50 Kota, Tanjung Baru* subdistrict situated at the District of *Luhak Tanah Datar*, and in *Baso, Bannhampu, and Tanjung Raya* Subdistricts located at the District of *Luhak Agam*. The study was conducted from January to June 2017. A total of 489 palatal rugae were observed in 48 palatal rugae models from 12 families. The study was conducted with the

door to door system in each subdistrict. Prints of jaws of the respondents were obtained after the research was explained to them and informed consent was provided. The Committee of the Research Ethics of the Faculty of Medicine, Andalas University, with regard to the protection of human rights and welfare in medical health research has carefully reviewed the research protocol with Ethical Clearance number 073 / KEP / FK2017 on March 2nd 2017.

Figure 1 : Delineation of palatal rugae pattern on dental casts

Maxillary impression using irreversible hydrocolloid alginate. The impression were casted using dental stone type 3. The jaws were printed using irreversible hydrocolloid material i.e., alginate. The result of the jaw printing was casted using dental stone tipe 3. The maxillary cast analysis was performed single-blind by two different observers to get accurate measurements and reliable results, then classified based on Thomas-Kotze and Sumita Kapali classification method. Observers are dentists of the Faculty of Dentistry University Andalas who have good eyesight, understanding and perception. The same procedure was used in length measurement and observation of palatal rugae patterns. The Result Measurement of each observer was tested using Technical Error of test Measurement (TEM) intra-observer and inter-observer. TEM test was performed on 20 samples of maxillary cast having primary rugae and secondary rugae.

RESULTS

This study was conducted to assess the similarity of palatal rugae patterns between family members, i.e., father, mother, sons and daughters of the *Minangkabau* ethnic. A total of 489 palatal rugae were observed in 48 palatal rugae models from 12 families. *One Way Anova*

test results of curved, wavy, and straight rugae are $p > 0.05$, which indicates that there is a significant similarity in the shape patterns. The results of the unilateral and circular rugae form test are $p < 0.05$, which also indicates that there is an insignificant similarity in the patterns of uniform and circular form. The results of the primary, secondary, and fragmented rugae test are $p > 0.05$, indicating a significant similarity in the palatal rugae patterns based on the family tie between the father, mother, sons and daughters of a *Minangkabau* family. The average number of palatal rugae and p value in this study are as follows:

Tabel 1: Average Amount of Palatal Rugae

Rugae Pattern		Mother	Father	son	Daughter	P
shape	Curve	2,92±1,67	4,08±1,92	3,08±1,78	2,92±1,37	0,28
	Wavy	2,92±1,67	3,42±1,92	4,05±2,19	4,75±2,52	0,11
	Straight	2,00±1,70	1,75±1,28	2,50±1,44	1,83±1,11	0,56
	Unified	1,50±1,16	0,50±0,90	1,08±0,99	0,50±0,67	0,03
	Circular	0	0	0,08±0,28	0,42±0,66	0,02
Size	Primary	7,25±1,81	7,83±1,26	8,33±1,07	8,17±1,26	0,24
	Secondary	1,67±1,37	1,83±1,40	2,17±1,74	1,75±1,13	0,83
	Fragmented	0,42±0,66	0,08±0,66	0,75±1,71	0,05±0,90	0,47

DISCUSSION

Sumatra, located on the westernmost extremity of Indonesia, is the second biggest island in Indonesia and the sixth biggest in the world. Its Western side largely corresponds with the cultural sphere of the *Minangkabau* people. *Luhak Nan Tigo -Luhak Agam, Luhak Tanah Datar and Luhak Lima Puluh* are areas where the traditions of the *Minangkabau* people were handed down on a large scale in the inland region of West Sumatra.⁶ This is the reason why the research was conducted at these locations. Palatal rugae are irregular, asymmetric ridges of mucous membrane extending lateral from the incisive papilla and the anterior part of the median palatal raphe, which is just behind the maxillary central incisor teeth.⁷ The use of palatal rugae as a method of personal identification was first suggested by Harrison Allen in 1889. The term "Palatal rugoscopy" was proposed in 1932, by a Spanish investigator named Trobo Hermosa.² Palatal rugae appears towards the third month of intrauterine life, from the covering connective tissue in the palatal process of maxillary bone, and its development and growth is mutually controlled by epithelial-mesenchymal interactions, where specific extra cellular matrix molecules are spatiotemporally expressed during development. Palatal rugae patterns are unique. The proposed individuality of palatal rugae patterns may facilitate their use in postmortem identification. This is reinforced by the fact that palatal rugae can resist postmortem decomposition changes for up to 7 days after death and can withstand massive thermal insults like third degree burns. Palatal rugae

can also resist other forms of massive trauma because their location is protected by the tongue, dentition, and cheeks.⁸ The identification of a person through DNA examination has limitations such as contamination and high cost. While the use of palatal rugae can provide ideal parameters because of its uniqueness, stability, resistance, and simple and inexpensive method. The potential use of palatal rugae in forensic identification has advantages because it is sufficiently able to discriminate between individuals as no two palatal rugae configurations are alike. Certain rugae patterns are specific to a particular population and may also have utility in population differentiation.⁹ Observing rugae patterns, Selvamani et al found that wavy patterns are common in males and females, followed by curved and straight patterns. Circular patterns are very few in number but significant ($P = 0.05$).¹⁰ Some scientists claim that environmental factors are unlikely to affect the formation of rugae and believe that its patterns are determined by genes. Genes influence the orientation of the collagen fibers during embryogenesis and govern rugae patterns in different populations.¹¹ Observing the length of rugae, it appears that primary rugae are most prevalent than secondary and fragmented rugae.¹² Examining the types and origins of palatal rugae according to the Lysell classifications, the study of Beatrice's (2013) showed that the palatal rugae of males is different from that of females. Primary and Secondary rugae are all found in males compared to females, whereas fragmented rugae are more common in females than males. Primary rugae

derived from raphae are found in males, whereas medial origin is found in many women, the study concludes.

Another study carried out by Patel to assess whether there is any hereditary pattern in palatal rugae patterns between the offspring and their parents. The study showed that there is a positive correlation of palatal rugae patterns between the offspring and either of their parents.¹⁵

Finally, a study by Indira suggests that the comparison of palatal rugae patterns among family members also shows different patterns. Although in one family few forms were similar, rugae patterns are not identical. This means that the role of heredity is uncertain in determining the orientation of rugae patterns.

CONCLUSION

The patterns of palatal rugae in *Minangkabau* family has the same number of rugae based on the significant shapes i.e., curved, wavy, and straight, and based on the significant length i.e., primary, secondary and fragmented. Because the results of this study are rather partial as they rely on a data consisting of only 48 individuals from 12 families, a more detailed follow-up study is needed with a larger sample size to reach an ultimate conclusion. The results of this study indicate that there are hereditary factors in the rugae patterns, which makes them very useful for the identification of individuals. Chemical, disease, heat, and trauma cannot alter palatal rugae patterns. Cheeks, lips, tongue, buccal pad of fat, teeth and bones protect palatal rugae from trauma and high temperature. Although we acknowledge that the limited number of families studied does not allow us to reach a final deduction, it is important to note that rugae patterns may be used as genetic markers for further research. We hope this research is a contribution of data in the field of forensic odontology on individuals, especially the *Minangkabau* and the *Deutro Melayu*.

Source of Funding: This research was funded by the Indonesian Ministry of Research and Technology (Kemrestek DIKTI) under the Elite Research Skim of Higher Education. The authors are grateful to LPPM and the Rector of Andalas University for facilitating this research.

Conflict of Interest: The authors confirm that there are no conflicts of interest to disclose.
